

KERTAS KERJA AUDIT (KKA)

Evidence Collection

Name of Organization/Audit:	Werdys Catering	KKA No.:	KKA120526
Audit Project Name:	Information Technology Audit	Audit Date:	[12/05/2026]
Auditors/Students:	Muhammad Daffa Al Fanyah	Page:	1 of 36

1. Audit Objective

The audit is conducted to assess whether the website system at Werdys Kitchen has adequate control in supporting the food ordering operational process, transaction data management, security of admin access, and customer ordering services through the website so that business processes can run effectively, safely, and controlled.

Audits are also conducted to ensure that:

- Admins can manage websites and transactions securely.
- Customers can order food through the website well.
- Customer transaction data is stored completely and accurately.
- Transaction history can be traced back if needed.
- Website operations run according to Werdys Kitchen's business procedures.

ID Control	Tested Controls	Testing Objectives	Evidence Collected	Criteria/Standards
AC-01	Admin Access Rights Management	To ensure that the admin account is only used by the authorities so that the security of the website is maintained	Screenshot admin login, active admin account, admin dashboard	ISO 27001 Annex A.9 – Access Control
TR-01	Customer Booking Process	To ensure that customers can order food through the website properly and transactions can be processed by the system	Customer order data, transaction history, checkout process	COBIT DSS01 – Manage Operations

DS-01	Order Data Management	To ensure that customer transaction data is stored completely, accurately, and does not experience data loss	Transaction database, customer order history	COBIT DSS01 – Manage Operations
DS-04	Data Backup and Storage	To ensure that the website data has a backup so that the data can still be recovered in the event of a system outage	Data backup and database storage documentation	COBIT DSS04 – Manage Continuity
APO-01	Website Operational Control	To ensure that the website's operational processes run according to procedures and support Werdys Kitchen's business activities	SOP for website use and booking flow	COBIT APO01 – Manage IT Management Framework
LG-01	Monitoring of System Activity	To ensure admin activity and customer transactions can be traced in case of system errors or misuse	Transaction history and admin activity	ISO 27001 Annex A.12 – Logging and Monitoring

2. Test Procedures

The evidence collection methodology is carried out to obtain relevant information and audit evidence in the audit process of the website system at Werdys Kitchen. Evidence collection is carried out to assess system control, customer ordering process, transaction management, and website operational security.

A. Inquiry

The inquiry method was carried out by conducting direct interviews with the owner and admin of the website at Werdys Kitchen. The interview was conducted to obtain information related to website management, customer order processing, transaction management, system security, and website operational control.

Inquiry Objective

1. Understand the operational process of the Werdys Kitchen website.
2. Know the mechanism of managing admin accounts on the system.
3. Understand the flow of food ordering made by customers through the website.
4. Ensure customer transaction data is stored on the system.
5. Knowing the process of monitoring customer transaction history.
6. Know the procedures for managing and securing transaction data.
7. Identify obstacles that occur during the use of the website.
8. Supporting the validity of the results of observation and system examination.

Interview Resource Persons

Resource Persons	Departments	Roles in the System
Owner of Werdys Kitchen	Owner / Admin Website	Manage website operations, customer transactions, and system management

Time and Implementation of Inquiry

Remarks	Explanation
Interview Method	Live interviews
Location	Werdys Kitchen Operations
Implementers	Group 3
Objek Inquiry	Website management and customer transactions
Fokus Inquiry	Security of admin access, customer booking process, and transaction data management

List of Inquiry Questions

Yes	Questions	Purpose of Inquiry
1	Who is responsible for managing the Werdys Kitchen website?	Know who is responsible for the system
2	How many admin accounts are used on a website?	Ensure admin access control
3	How is the admin login process done on the system?	Knowing the authentication mechanism of a website
4	How do customers order food through the website?	Understand customer transaction flows
5	Is customer transaction data automatically stored on the system?	Ensure the management of transaction data
6	Can customer transaction history be restored?	Ensure monitoring of transaction activity
7	Is there a regular data backup?	Know the data security procedures

8	Are there any problems during the use of the website?	Identify system operational risks
9	What is the process of managing the food menu on the admin dashboard?	Ensure website operations run smoothly
10	Has the website ever experienced a system crash or data loss?	Knowing the potential risks of the system

Inquiry Results

Aspects Covered	Interview Results
Website Management	The website is managed directly by the business owner
Admin Account	The system has only 1 active admin account
System Login	Login is done using username and password
Ordering Process	Customers can place orders directly through the website
Transaction Data Management	Transaction data is automatically stored in the website database
Transaction History	Transaction history can be displayed back on the admin dashboard
Backup Data	Data backups have not been done regularly
Menu Management	Admins can add and change food menu data
Operational Constraints	No major obstacles were found during the operation of the website

Analysis of Inquiry Results

Based on the results of the interview conducted:

- Website management is still carried out centrally by business owners using one active admin account.
- The customer order process through the website has run directly and is integrated with the storage of transaction data.
- The system is able to store transaction history so that customer booking activity can be traced back if needed.
- The data backup process has not been carried out periodically, so it has the potential to increase the risk of data loss in the event of a system disruption or database corruption.
- Website operations have supported the food ordering business process at Werdys Kitchen.

Inquiry Relationship with Audit Control

ID Control	Relevance of Inquiry Results	Standard	System Conditions Based on Interviews	Status
AC-01	The system has only 1 active admin account	ISO 27001 Annex A.9 – Access Control	The website is managed directly by the owner using one admin account with a username and password login	Meet
TR-01	Customers can order food through the website	COBIT DSS01 – Manage Operations	The customer booking process is running well on the website	Meet
DS-01	Customer transaction data is stored in the website database	COBIT DSS01 – Manage Operations	Transaction data is automatically stored on the website system	Meet
DS-04	Data backup management on the website system	COBIT DSS04 – Manage Continuity	Data backups have not been done regularly so there is still a risk of data loss	Not Fulfilled
APO-01	Website operational management is carried out directly by the admin	COBIT APO01 – Manage IT Management Framework	Admin can manage the food menu and website operations run well	Meet
LG-01	Customer transaction history can be displayed again	ISO 27001 Annex A.12 – Logging and Monitoring	Transaction history can be displayed back on the admin dashboard	Meet

Conclusion of Inquiry

Based on the results of the inquiry, the website system at Werdys Kitchen has supported the operational process of food ordering and customer transaction management quite well. The admin login system runs according to the authentication mechanism and customer transaction data is stored in the system and can be displayed again through transaction history. However, the data backup process has not been carried out periodically so there are still risks to the security and sustainability of transaction data on the website.

B. Observation

The observation method is carried out by directly observing the process of using the website at Werdys Kitchen both from the admin side and customers who place orders through the website. Observations are carried out to ensure that the operational processes, system features, access security, and website appearance run in accordance with Werdys Kitchen's business needs.

Observation Objective

1. Observe the admin login process on the website.
2. Observe the use of the sidebar feature and the admin dashboard quick action.
3. Observe the process of managing the food menu by the admin.
4. Observe the system security mechanism in the form of an admin auto-logout.
5. Observe the process of customers ordering food through the website.
6. Observe the customer checkout process.
7. Observe the customer order tracking feature via email.
8. Observe the process of storing customer transactions on the system.
9. Identify problems with the appearance and function of the website from the user and admin side.
10. Supporting the validity of inquiry results and system audit processes.

Object Observation

Objects Observed	Remarks
Login Admin	Website admin authentication process
Sidebar Admin	Navigation menu on the admin dashboard
Quick Action Dashboard	Quick navigation feature on the admin dashboard
Auto Logout System	Admin automatic logout mechanism
Menu Management	Food menu data management
Customer Website	Customer-accessed website view
Customer Booking	Customer transaction process
Customer Checkout	Booking confirmation process
Order Tracking	Order tracking via email
Transaction History	Customer transaction history
Navbar Website	Website identity and navigation
Banner Website	Display of the main banner of the website
About Us	Business profile information
Contact Us	Website social media integration
Generate Report	Admin transaction report features

Implementation of Observation

Remarks	Explanation
Observation Method	Direct observation
Location	Werdys Kitchen Operations
Implementers	Group 3
Focus Observation	Admin and customer activity on the website
Average Observasi	Website Werdys Kitchen

Observed Activities

Yes	Observation Activities	Observation Objectives
1	Admin login to the website dashboard	Ensure system authentication runs smoothly
2	Use of admin sidebar menu	Ensure the entire sidebar menu is usable properly
3	Use of quick action dashboard	Ensure the quick action feature runs properly
4	Food menu management by admin	Make sure admins can manage menu data
5	Admin auto-logout observation	Ensure the security of admin sessions runs smoothly
6	The customer opens the website page	Ensure the website is accessible to customers
7	Customers choose a food menu	Make sure the booking feature works properly
8	The customer checkout the order	Ensure customer transactions are processed successfully
9	Order tracking via email	Ensure the order tracking feature runs smoothly
10	Storage of customer transaction data	Ensure transaction data is stored on the system
11	Appearance of customer transaction history	Ensure customer transactions are traceable back
12	Website navbar view check	Ensure your website identity performs well
13	Website banner check	Ensure the banner looks in line with the original image
14	About Us page check	Ensure business information is clearly displayed

15	Check the Contact Us feature	Ensure social media links work properly
16	Checking the generate report feature	Ensure the transaction report feature runs well

Observation Results

Observed Aspects	Observation Results
Login Admin	The admin successfully logged in using the username and password
Sidebar Admin	The entire sidebar menu can be used and point to the appropriate page
Quick Action Dashboard	The quick action feature works well
Auto Logout System	The system automatically logs out after the admin is inactive for ±20 minutes
Menu Management	Admins can add and change food menu data
Customer Website	The website is well accessible to customers
Ordering Process	The customer successfully placed a food order
Customer Checkout	The system successfully processes customer transactions
Order Tracking	Customers can track orders via email well
Data Storage	Customer transaction data is successfully stored on the system
Transaction History	Customer transaction history can be displayed again
Generate Report	The generate report button can't generate a transaction report
Navbar Website	The Werdys Kitchen logo does not appear on the navbar of the website
Banner Website	Website banners are cropping so that the image is cropped
About Us	Business information is not clearly displayed and does not have a description
Contact Us	Social media links display 404 errors

*Evidence of Observation

Evidence ID	Description of Evidence
OBS-01	Screenshot login admin
OBS-02	Screenshot sidebar admin
OBS-03	Screenshot quick action dashboard

OBS-04	Screenshot auto logout admin
OBS-05	Screenshot of food menu management
OBS-06	Screenshot of the customer's website display
OBS-07	Screenshot of the customer checkout process
OBS-08	Screenshot of order tracking via email
OBS-09	Screenshot of admin-side customer transaction history
OBS-10	Screenshot navbar website
OBS-11	Screenshot of a website banner that is cropping
OBS-12	Screenshot halaman About Us
OBS-13	Screenshot of error 404 on Contact Us
OBS-14	Screenshot of the generate report button

**Note: Proof of screenshots or screenshots will be included in a separate file.*

Analysis of Observation Results

Based on the results of the observations made:

- The admin login system works well using usernames and passwords.
- All sidebar menus and quick action features on the admin dashboard can be used well to support website operations.
- The system has an auto logout feature that runs automatically after the admin is inactive for approximately 20 minutes, thus supporting system access security.
- The website can be used by customers to order food and the checkout process goes well.
- The order tracking feature via email works well so that customers can track the status of orders.
- Customer transaction data is successfully stored in the admin system and transaction history can be displayed again.

However, there are several shortcomings in the appearance and functionality of the website, namely:

- The generate report button can't generate a transaction report.
- The website logo does not appear on the navbar.
- Website banners are cropping so that the image does not appear in its entirety.
- The About Us page doesn't have complete business information yet.
- The social media link in Contact Us is not working and displays a 404 error.

The Relationship of Observation to Audit Controls

ID Control	Kaitan Hasil Observation	Standard	System Conditions Based on Observations	Status
AC-01	The admin login system is working fine	ISO 27001 Annex A.9 – Access Control	Admin successfully logged in using a valid account	Meet
AC-02	The admin auto logout system is working fine	ISO 27001 Annex A.9 – Session Management	Automatic logout system after admin is inactive $\pm$ 20 minutes	Meet

APO-01	The admin sidebar and quick action dashboard work well	COBIT APO01 – Manage IT Management Framework	The entire sidebar menu and quick action can be used	Meet
TR-01	The customer successfully placed a food order	COBIT DSS01 – Manage Operations	The system successfully processes customer transactions	Meet
TR-02	Tracking customer orders via email is going well	ISO 25010 – Functional Suitability	Order tracking feature works well	Meet
DS-01	Customer transaction data is stored on the system	COBIT DSS01 – Manage Operations	Transaction data is successfully stored on the system	Meet
RP-01	Generate reports on the admin dashboard	ISO 25010 – Functional Suitability	Generate report doesn't generate transaction reports	Not Fulfilled
UI-01	Website appearance and identity	ISO 25010 – Usability	The website logo does not appear and the About Us information is not complete	Not Fulfilled
UI-02	Website banner display	ISO 25010 – User Interface Aesthetics	Website banners are cropping	Not Fulfilled
UI-03	Contact Us feature integration	ISO 25010 – Functional Suitability	Social media links display 404 errors	Not Fulfilled
LG-01	Admin customer transaction history	ISO 27001 Annex A.12 – Logging and Monitoring	Transaction history can be displayed again	Meet

Conclusion Observation

Based on the results of observations, the website system at Werdys Kitchen has been running well in supporting the operational process of food ordering and customer transaction management. The system successfully supports admin and customer activities ranging from the admin login process, the use of the sidebar and quick action dashboard, food menu management, customer orders, checkout processes, order tracking via email, to storing transaction data on the website system.

The system also has an auto logout mechanism on the admin dashboard to support system access security. However, there are still some shortcomings in terms of functionality and website appearance, such as the generate report button that does not work, the website logo that does not appear on the navbar, the website banner that is

cropped so that the image is cropped off, About Us information is not clear, and the Contact Us feature that does not work properly because the social media link still displays a 404 error.

C. Inspection (Document and System Inspection)

The inspection method is carried out by directly checking the data, system display, website features, and proof of transaction on the Werdys Kitchen website. Unlike observation which focuses on observing user activity while the system is running, the inspection method focuses more on examining the results, evidence, and output of the website system.

Inspection Objective

1. Ensure customer transaction data is properly stored in the system.
2. Ensure the admin dashboard feature runs as it functions.
3. Ensure the entire admin sidebar menu is usable properly.
4. Ensure customer transaction history is stored on the system.
5. Ensure the order tracking feature via email runs according to the system output.
6. Checking the appearance and completeness of website information.
7. Make sure the Contact Us feature is properly connected.
8. Ensure the generate report feature can generate transaction reports.
9. Ensure the display of the website banner matches the uploaded image.
10. Supporting the validity of observation and inquiry results.

Object Inspection

Inspected Objects	Remarks
Dashboard Admin	Website management view
Sidebar Admin	Admin dashboard navigation menu
Quick Action Dashboard	Dashboard quick navigation feature
Form Checkout Pelanggan	Customer data input form when ordering
Customer Transaction Data	Transaction data stored on the system
Transaction History	Customer transaction history
Order Tracking	Output order tracking via email
Generate Report	Transaction report output
Navbar Website	Website identity display
Banner Website	Display of the main banner of the website

About Us	Business profile information
Contact Us	Website social media links

Inspection Implementation

Remarks	Explanation
Metode Inspection	Direct inspection of the system and website output
Location	Werdys Kitchen Operations
Implementers	Group 3
Fokus Inspection	Transaction data, system features, and website display
Average Observasi	Website Werdys Kitchen

Checked Activities

Yes	Inspection Activities	Purpose of Examination
1	Admin dashboard check	Ensure the dashboard is usable properly
2	Admin sidebar check	Ensure the entire sidebar menu is usable
3	Quick action dashboard check	Ensure the quick action feature runs properly
4	Customer checkout form check	Ensure customer data can be properly input and processed
5	Customer transaction data check	Ensure transactions are stored on the system
6	Checking customer transaction history	Ensure transaction history is available on the system
7	Email order tracking check	Ensure the order tracking output is compliant
8	Generate report check	Ensure the system can generate transaction reports
9	Website navbar check	Make sure your website logo looks good
10	Website banner check	Make sure your banner image looks appropriate

11	About Us page check	Ensure business information is available
12	Check the Contact Us feature	Ensure social media links run well

Inspection Results

Aspects Examined	Examination Results
Dashboard Admin	Dashboard can be used well
Sidebar Admin	The entire sidebar menu is well used
Quick Action Dashboard	All quick action features run well
Form Checkout Pelanggan	Customer data such as name, address, WhatsApp number, email, and notes were successfully input and processed without any problems
Customer Transaction Data	Customer transaction data is successfully stored on the system
Transaction History	Customer transaction history is available and can be displayed back on the admin side
Order Tracking	Order tracking via email went well
Generate Report	Generate report can't generate transaction reports
Navbar Website	The Werdys Kitchen logo does not appear on the navbar
Banner Website	Website banners are cropping so that the image is cropped
About Us	Business information has not been fully displayed
Contact Us	Social media links display 404 errors

*Evidence of Inspection

Evidence ID	Description of Evidence
INS-01	Screenshot dashboard admin
INS-02	Screenshot sidebar admin
INS-03	Screenshot quick action dashboard
INS-04	Screenshot form checkout pelanggan
INS-05	Screenshot of admin-side customer transaction data
INS-06	Screenshot of admin-side customer transaction history
INS-07	Screenshot of order tracking via email

INS-08	Screenshot of the generate report button
INS-09	Screenshot navbar website
INS-10	Screenshot banner website
INS-11	Screenshot halaman About Us
INS-12	Screenshot of error 404 on Contact Us

**Note: Proof of screenshots or screenshots will be included in a separate file.*

Analysis of Inspection Results

Based on the results of the inspection carried out:

- The admin dashboard, admin sidebar, and quick action dashboard are successfully used to support website operations.
- The customer checkout form successfully processes data inputs such as customer name, address, WhatsApp number, email, and notes without any problems.
- Customer transaction data is successfully stored in the system and transaction history can be displayed again.
- The order tracking feature via email successfully displays the status of the customer's order.
- The system successfully supports the customer transaction process and website operational management.

However, there are still some drawbacks to the functionality and appearance of the website, namely:

- Generate report can't generate transaction reports yet.
- The website logo does not appear on the navbar.
- Website banners are cropping so that the image does not appear in its entirety.
- The About Us page doesn't have complete business information yet.
- Contact Us is not working properly because social media links are still displaying 404 errors.

The Relationship of Testing to Audit Controls

ID Control	Relevance of Inspection Results	Standard	System Conditions Based on Inspection	Status
AC-01	The admin dashboard is well accessible	ISO 27001 Annex A.9 – Access Control	Admin successfully accessed the dashboard using a valid account	Meet
APO-01	Admin sidebar and quick action work well	COBIT APO01 – Manage IT Management Framework	The entire sidebar menu and quick action can be used	Meet
TR-01	The system successfully processes customer transactions	COBIT DSS01 – Manage Operations	Checkout forms successfully process customer and transaction data	Meet

TR-02	Customer order tracking is going well	ISO 25010 – Functional Suitability	Order tracking via email successfully runs	Meet
DS-01	Customer transaction data is stored on the system	COBIT DSS01 – Manage Operations	Transaction data is successfully stored in the database	Meet
RP-01	Generate report dashboard admin	ISO 25010 – Functional Suitability	Generate report doesn't generate transaction reports	Not Fulfilled
UI-01	Website appearance and identity	ISO 25010 – Usability	The website logo does not appear and About Us is not complete	Not Fulfilled
UI-02	Website banner display	ISO 25010 – User Interface Aesthetics	Website banners are cropping	Not Fulfilled
UI-03	Contact Us feature integration	ISO 25010 – Functional Suitability	Social media links display 404 errors	Not Fulfilled

Inspection Conclusion

Based on the results of the inspection carried out on the Werdys Kitchen website, most of the main functions of the system have been running well and supporting the operational processes of the website. Admin dashboard, admin sidebar, quick action dashboard, customer checkout form, order tracking via email, and transaction history successfully run according to the system's operational needs.

The results of the inspection also show that the customer's checkout process can process data such as name, address, WhatsApp number, email, and notes without any problems, as well as transaction data successfully stored in the system.

However, there are still some weaknesses in terms of functionality and website appearance, namely:

- The generate report feature has not been able to generate transaction reports.
- The website logo does not appear on the navbar.
- Website banners are cropping so that the image does not appear in its entirety.
- The About Us page does not yet display complete business information.
- Social media links in the Contact Us feature still show a 404 error.

Based on the results of the inspection, it can be concluded that the Werdys Kitchen website system has supported the transaction process and the main operation of the website quite well, but still needs improvements to the reporting features, interface display, and integration of several website features so that the system can run more optimally and informatively for users and admins.

D. Re-performance

The re-performance method is carried out by the auditor directly retrying the features and processes on the Werdys Kitchen website to ensure that the system runs consistently according to its intended function.

In contrast to observation that focuses on observing user activity, and inspections that focus on examining data or system output, the re-performance method is carried out by re-running the system process directly by the auditor to prove whether the feature is really running properly.

Re-performance Objectives

1. Make sure the admin login feature is working properly.
2. Ensure the sidebar menu and quick action dashboard can be used consistently.
3. Ensure the customer checkout process can run smoothly.
4. Ensure the order tracking feature via email runs well.
5. Ensure the admin auto logout mechanism runs according to the security system.
6. Ensure transaction history can be restored.
7. Ensure the generate report feature can generate transaction reports.
8. Ensure the dashboard summary displays accurate and actual transaction data.
9. Testing the stability of the website when receiving repeated transaction activity.
10. Supporting the validity of observation and inspection results.

Object Re-performance

Retested Objects	Remarks
Login Admin	Admin authentication process
Sidebar Admin	Admin dashboard navigation
Quick Action Dashboard	Dashboard quick navigation feature
Auto Logout System	Admin automatic logout mechanism
Form Checkout Pelanggan	Customer data input process
Order Tracking	Order tracking via email
Transaction History	Customer transaction history
Generate Report	Creation of transaction reports
Dashboard Summary	Admin dashboard activity summary
Website Stability	Website resilience to transaction activity

Implementation of Re-performance

Remarks	Explanation
Re-performance Method	Direct retesting of system features
Location	Werdys Kitchen Operations
Implementers	Group 3
Fokus Re-performance	Consistency of system functionality and website stability
Average Observasi	Website Werdys Kitchen

Retest Activities

Yes	Re-performance Activities	Testing Objectives
1	Try admin login again	Ensure authentication runs consistently
2	Try the entire admin sidebar menu	Ensure the entire menu is usable
3	Try the quick action dashboard	Ensure the quick action feature runs properly
4	Test admin auto-logout	Ensure the automatic logout system runs
5	Try the customer checkout process	Ensure customer transactions can be processed
6	Input customer checkout data	Ensure checkout forms can accept data input
7	Try tracking orders via email	Make sure tracking features work properly
8	Trying to view transaction history	Ensure transaction history is available
9	Try to generate a report	Ensure transaction reports can be generated
10	Check the admin dashboard activity summary	Ensure dashboard summary displays actual transaction data
11	Make recurring bookings in close proximity using desktop	Testing the stability of your website against high transaction activity

Re-performance results

Aspects Tested	Test Results
Login Admin	Login was successful using the admin account
Sidebar Admin	The entire sidebar menu runs fine
Quick Action Dashboard	All quick action features run well
Auto Logout System	The system successfully logs out automatically after the admin is inactive for ±20 minutes
Form Checkout Pelanggan	The checkout form successfully received input of name, address, WhatsApp number, email, and notes
Customer Checkout	The system successfully processes customer transactions
Order Tracking	Order tracking via email went well
Transaction History	Transaction history successfully displayed again on the admin side
Generate Report	Generate report failed to generate transaction report
Dashboard Summary	Dashboard activity summaries such as products sold and orders processed do not show actual data and do not change as per system transactions
Website Stability	The website experiences an error/crash if repeated orders are made in close proximity using the desktop so it needs to be refreshed and wait for approximately 10 minutes

***Evidence Re-performance**

Evidence ID	Description of Evidence
REP-01	Screenshot of admin login successful
REP-02	Screenshot sidebar admin
REP-03	Screenshot quick action dashboard
REP-04	Screenshot auto logout admin
REP-05	Screenshot form checkout pelanggan
REP-06	Email order tracking screenshot
REP-07	Screenshot of customer transaction history
REP-08	Screenshot generate report gagal
REP-09	Screenshot dashboard summary admin
REP-10	Website screenshot encounters error/crash when booking is repeated

**Note: Proof of screenshots or screenshots will be included in a separate file.*

Analysis of Re-performance Results

Based on the results of the re-performance carried out:

- The admin login system works well and can be used consistently.
- All admin sidebar menus and quick action features work well.
- The auto logout system works fine after the admin has been inactive for approximately 20 minutes.
- The customer's checkout form successfully received customer data input without any problems.
- The order tracking via email went well and successfully displayed the status of the order.
- The customer's transaction history is successfully displayed again on the admin dashboard.

However, several weaknesses were found in the website system, namely:

- Generate report can't generate transaction reports yet.
- The admin dashboard activity summary doesn't show actual, real-time transaction data yet.
- The website experiences an error or crash if repeated bookings are made in the same time frame using the desktop.
- The system requires a page refresh and a waiting time of approximately 10 minutes before it can be used again after the error occurs.

The Relationship of Re-performance with Audit Control

ID Control	Relevance of Re-performance Results	Standard	System Conditions Based on Testing	Status
AC-01	Admin login is working fine	ISO 27001 Annex A.9 – Access Control	The admin successfully logged in using a valid account	Meet
AC-02	The admin logout is working fine	ISO 27001 Annex A.9 – Session Management	Automatic logout system after admin is inactive $\pm$ 20 minutes	Meet
APO-01	The admin sidebar and quick action dashboard work well	COBIT APO01 – Manage IT Management Framework	All sidebar menus and quick actions run well	Meet
TR-01	Customer checkout successfully processed	COBIT DSS01 – Manage Operations	The system successfully processes customer transactions	Meet
TR-02	Customer order tracking is going well	ISO 25010 – Functional Suitability	Order tracking via email successfully runs	Meet
RP-01	Generate report dashboard admin	ISO 25010 – Functional Suitability	Generate report doesn't generate transaction reports	Not Fulfilled

RP-02	Dashboard summary admin	ISO 25010 – Functional Suitability	The summary dashboard does not show actual transaction data	Not Fulfilled
PF-01	Website stability and performance	ISO 25010 – Performance Efficiency	The website crashes when the transaction is repeated in close proximity	Not Fulfilled
LG-01	Customer transaction history	ISO 27001 Annex A.12 – Logging and Monitoring	Transaction history successfully displayed again on the admin side	Meet

Conclusion Re-performance

Based on the results of the re-performance, most of the features on the Werdys Kitchen website have run well and consistently, starting from admin login, dashboard sidebar, quick action, customer checkout, order tracking via email, auto logout, to customer transaction history.

However, there are still weaknesses in the generate report feature that has not run properly, dashboard summaries that do not display actual data, and website stability that still experiences errors or crashes when receiving repeated booking activities in the same time using the desktop.

E. CAATs (Computer Assisted Audit Techniques)

The CAATs (Computer Assisted Audit Techniques) method is carried out using the help of the admin dashboard on the Werdys Kitchen website to help auditors check customer transaction data, transaction history, dashboard summary, and system reporting functions more quickly and accurately.

Unlike the previous method which focused on observing user activity and testing features directly, the CAATs method focuses more on data examination and transaction monitoring using the website admin dashboard media.

Objectives of CAATs

1. Ensure customer transaction data is stored on the system.
2. Ensure customer transaction history can be restored.
3. Ensure the dashboard summary displays actual transaction data.
4. Ensure the generate report feature can generate transaction reports.
5. Ensure that customer order form data is stored completely without empty/null values.
6. Help auditors check transaction data more efficiently.
7. Supporting the validity of observation, inspection, and re-performance results.

Object CAATs

Inspected Objects	Remarks
Dashboard Admin	Transaction data management view
Transaction History	Customer transaction history data
Dashboard Summary	Summary of transaction activity
Generate Report	Transaction report features
Customer Order Form	Customer checkout data

Implementation of CAATs

Remarks	Explanation
CAATs Method	Data check using the admin dashboard
Location	Werdys Kitchen Operations
Implementers	Group 3
Focus on CAATs	Transaction data and reporting system
Average Observasi	Website Werdys Kitchen

CAATs Activities

Yes	Testing Activities	Testing Objectives
1	Checking customer transaction history	Ensure transaction data is stored on the system
2	Dashboard summary admin check	Ensure activity summaries show actual data
3	Generate report check	Ensure the system can generate transaction reports
4	Checking transaction data on the admin dashboard	Ensure transaction data can be displayed again
5	Checking customer order form data	Ensure booking data doesn't have an empty/null value

CAATs Results

Aspects Examined	Test Results
Transaction History	Customer transaction history successfully re-displayed

Dashboard Summary	The dashboard activity summary does not show actual transaction data and does not change as per system transactions
Generate Report	Generate report failed to generate transaction report
Transaction Data Dashboard	Customer transaction data is successfully displayed on the admin dashboard
Booking Form Data	No empty/null data found on the customer's order form

***Proof of CAATs**

Evidence ID	Description of Evidence
CAT-01	Screenshot of customer transaction history
CAT-02	Screenshot dashboard summary admin
CAT-03	Screenshot generate report gagal
CAT-04	Screenshot of transaction data on admin dashboard
CAT-05	Screenshot of customer order form data

**Note: Proof of screenshots or screenshots will be included in a separate file.*

Analysis of CAATs Results

Based on the results of the CAATs conducted:

- The admin dashboard successfully displays customer transaction data and transaction history well.
- Customer transaction history can be displayed back on the admin dashboard to help the transaction monitoring process.
- Customer transaction data is successfully displayed on the admin dashboard.
- Checking the order form data shows that customer data such as name, address, WhatsApp number, email, and notes was successfully stored without finding any empty/null value in the system.

However, there are still several weaknesses in the admin dashboard reporting feature, namely:

- The dashboard summary does not display transaction data in real and real-time.
 - Activity summaries such as products sold and orders processed do not change as per system transactions.
 - Generate reports can't generate transaction reports automatically yet.
- The findings show that the integration of data reporting and dashboard monitoring in the system is still not running optimally.

The Relationship of CAATs to Audit Controls

ID Control	Relevance of CAATs Results	Standard	System Conditions Based on CAATs	Status
DS-01	Customer transaction history is available on the system	COBIT DSS01 – Manage Operations	Transaction history successfully displayed again	Meet

DS-02	Complete customer order form data stored	COBIT DSS01 – Manage Operations	No empty/null data found on the customer's order form	Meet
RP-01	Generate report dashboard admin	ISO 25010 – Functional Suitability	Generate report doesn't generate transaction reports	Not Fulfilled
RP-02	Dashboard summary admin	ISO 25010 – Functional Suitability	The summary dashboard does not show actual transaction data	Not Fulfilled
LG-01	Customer transaction data on the admin dashboard	ISO 27001 Annex A.12 – Logging and Monitoring	Transaction data is successfully displayed on the admin dashboard	Meet

Conclusion of CAATs

Based on the results of CAATs carried out on the Werdys Kitchen website admin dashboard, the system has been able to display customer transaction data and transaction history well so as to support the website operational monitoring process. Checking the order form data also shows that customer data such as name, address, WhatsApp number, email, and notes has been successfully stored completely without finding any empty/null values in the system.

However, there are still weaknesses in the reporting and dashboard monitoring features, namely the dashboard summary which does not display actual transaction data in real-time and the generate report feature which cannot produce transaction reports automatically.

F. Method Sampling

The sampling method is carried out by selecting one customer transaction as a test sample to ensure that the process of changing transaction status on the Werdys Kitchen website runs according to the function that has been designed. Samples are selected using Purposive Sampling, which is sample selection based on auditors' consideration of transactions that are considered to be representative of the system's business processes.

In contrast to the observation method that focuses on observing user activity and re-performance that focuses on retesting system features, the sampling method focuses on examining one selected transaction to trace the consistency of transaction status changes between the admin dashboard and the customer order tracking page.

Purpose of Sample Testing

1. Ensure admins can change the status of transactions.
2. Ensure status changes are stored on the system.
3. Ensure the latest status can be displayed to customers.
4. Ensure data consistency between the admin dashboard and the customer page.
5. Ensure that the transaction update process runs according to operational needs.

Object Sampling

Inspected Objects	Remarks
Customer Transaction Data	1 transaction selected as a sample
Dashboard Admin	Transaction status change media
Order Tracking	Media verification of customer transaction status
Transaction Status	Pending, Processing, Completed, Cancelled

Sampling Implementation

Remarks	Explanation
Method Sampling	Purposive Sampling
Location	Werdys Kitchen Operations
Implementers	Group 3
Fokus Sampling	Consistency of transaction status changes
Average Observasi	Website Werdys Kitchen

Sampling Activities

Yes	Testing Activities	Testing Objectives
1	Selecting 1 customer transaction as a sample	Define a test object
2	Check the status of Pending transactions on the admin dashboard	Ensure the initial status of the transaction
3	Change the transaction status to Processing	Ensure the system saves state changes
4	Verify the Processing status on the customer tracking page	Ensure changes are shown to customers
5	Change the status of a transaction to Completed	Ensure the system saves state changes
6	Verify the status of Completed on the customer tracking page	Ensure changes are shown to customers
7	Change the status of a transaction to Cancelled	Ensure the system saves state changes

8	Verify the Cancelled status on the customer tracking page	Ensure changes are shown to customers
---	---	---------------------------------------

Sampling Results

Aspects Examined	Test Results
Status Pending	Successfully displayed on admin dashboard and customer page
Status Processing	Successfully updated and displayed on the customer page
Status Completed	Successfully updated and displayed on the customer page
Status Cancelled	Successfully updated and displayed on the customer page
Data Consistency	No difference in status between admin and customer found

Evidence Sampling

Evidence ID	Description of Evidence
SMP-01	Screenshot of Pending status on admin dashboard
SMP-02	Screenshot of Pending status on customer tracking page
SMP-03	Screenshot of the Processing status on the admin dashboard
SMP-04	Screenshot of the Processing status on the customer tracking page
SMP-05	Screenshot of Completed status on admin dashboard
SMP-06	Screenshot of the Completed status on the customer tracking page
SMP-07	Screenshot of Cancelled status on admin dashboard
SMP-08	Screenshot of Cancelled status on customer tracking page

Analysis of Sampling Results

Based on the results of sampling conducted on one customer transaction, the system successfully saves and displays every change in transaction status made through the admin dashboard. Status changes from Pending, Processing, Completed, to Cancelled are successfully displayed consistently on the customer's order tracking page.

The test results show that the transaction status management mechanism has been running in accordance with the operational needs of the website. No data discrepancies were found between the admin dashboard and the customer page during the testing process.

The Relationship of Sampling to Audit Control

ID Control	Relevance of Sampling Results	Standard	System Conditions Based on Sampling	Status
TR-01	Transaction status changes are processed successfully	COBIT DSS01 – Manage Operations	Transaction status is successfully updated on the system	Meet
TR-02	Customer order tracking is going well	ISO 25010 – Functional Suitability	Successful transaction status is displayed to customers	Meet
DS-01	Consistency of transaction data	COBIT DSS01 – Manage Operations	No data discrepancies found between admins and customers	Meet
LG-01	Monitoring the status of the transaction	ISO 27001 Annex A.12 – Logging and Monitoring	Transaction status history can be traced through the system	Meet

Sampling Conclusion

Based on the results of sampling conducted on one customer transaction, the Werdys Kitchen website system managed to manage changes in transaction status consistently. Status changes made by admins are successfully saved in the system and displayed back to customers through the order tracking feature. The test results show that the transaction status management function has been running well and supports the customer order monitoring process.

3. Table of Evidence Collection Results

Evidence ID	Audit Methods	Audit Object	Evidence Obtained	Findings	Standards/Controls	Status
INQ-01	Inquiry	Login Admin	Admin interview results related to the login process	Admin uses username and password to access the dashboard	ISO 27001 Annex A.9 – Access Control	Meet
INQ-02	Inquiry	Website Management	Interview results related to menu management and transactions	The website is managed by 1 admin account	COBIT APO01 – Manage IT Management Framework	Meet
INQ-03	Inquiry	Backup Data	Interview results related to system backup	Data backups have not been done regularly	ISO 27001 Annex A.12 – Backup	Not Fulfilled
OBS-01	Observation	Sidebar Admin	Screenshot dashboard admin	The entire sidebar menu is well used	COBIT APO01 – Manage IT Management Framework	Meet
OBS-02	Observation	Quick Action Dashboard	Screenshot quick action dashboard	All quick action features run well	COBIT APO01 – Manage IT Management Framework	Meet
OBS-03	Observation	Auto Logout System	Screenshot auto logout admin	Automatic logout system after admin is inactive ± 20 minutes	ISO 27001 Annex A.9 – Session Management	Meet
OBS-04	Observation	Customer Checkout	Screenshot of the customer checkout process	Customer successfully checkout	COBIT DSS01 – Manage Operations	Meet

OBS-05	Observation	Order Tracking	Email order tracking screenshot	Order tracking via email went well	ISO 25010 – Functional Suitability	Meet
OBS-06	Observation	Generate Report	Screenshot generate report	Generate report fails to generate transaction report	ISO 25010 – Functional Suitability	Not Fulfilled
OBS-07	Observation	Navbar Website	Screenshot navbar website	Website logo doesn't appear on navbar	ISO 25010 – Usability	Not Fulfilled
OBS-08	Observation	Banner Website	Screenshot banner website	Banner suffers from cropping until the image is cropped	ISO 25010 – User Interface Aesthetics	Not Fulfilled
OBS-09	Observation	About Us	Screenshot halaman About Us	Business information is incomplete	ISO 25010 – Usability	Not Fulfilled
OBS-10	Observation	Contact Us	Screenshot of 404 error page	Social media links display 404 errors	ISO 25010 – Functional Suitability	Not Fulfilled
INS-01	Inspection	Form Checkout Pelanggan	Screenshot form checkout	Name, address, WhatsApp number, email, and notes data are processed successfully	COBIT DSS01 – Manage Operations	Meet
INS-02	Inspection	Transaction History	Screenshot of transaction history	Transaction history successfully displayed again	ISO 27001 Annex A.12 – Logging and Monitoring	Meet

INS-03	Inspection	Dashboard Admin	Screenshot dashboard admin	The admin dashboard is well used	COBIT APO01 – Manage IT Management Framework	Meet
INS-04	Inspection	Generate Report	Screenshot generate report	Generate report doesn't generate transaction reports	ISO 25010 – Functional Suitability	Not Fulfilled
INS-05	Inspection	Contact Us	Screenshot of 404 error page	Social media links don't connect well	ISO 25010 – Functional Suitability	Not Fulfilled
REP-01	Re-performance	Login Admin	Screenshot login successful	Admin login successfully restarted	ISO 27001 Annex A.9 – Access Control	Meet
REP-02	Re-performance	Sidebar dan Quick Action	Screenshot dashboard admin	Sidebar and quick actions run consistently	COBIT APO01 – Manage IT Management Framework	Meet
REP-03	Re-performance	Auto Logout	Screenshot auto logout	The automatic logout system works well	ISO 27001 Annex A.9 – Session Management	Meet
REP-04	Re-performance	Customer Checkout	Customer checkout screenshot	Customer checkout successfully reprocessed	COBIT DSS01 – Manage Operations	Meet
REP-05	Re-performance	Order Tracking	Screenshot tracking email	Order tracking is going well	ISO 25010 – Functional Suitability	Meet
REP-06	Re-performance	Dashboard Summary	Screenshot dashboard summary	The dashboard summary does not show actual data	ISO 25010 – Functional Suitability	Not Fulfilled

REP-07	Re-performance	Website Stability	Screenshot website crash	Website crashes/errors when booking repeats with close time spans	ISO 25010 – Performance Efficiency	Not Fulfilled
CAT-01	CAATs	Transaction History	Screenshot of transaction history	Transaction history successfully displayed on the admin dashboard	COBIT DSS01 – Manage Operations	Meet
CAT-02	CAATs	Booking Form Data	Screenshot of customer transaction data	No empty/null data found on the customer's order form	COBIT DSS01 – Manage Operations	Meet
CAT-03	CAATs	Dashboard Summary	Screenshot dashboard summary	The summary dashboard does not show actual transaction data	ISO 25010 – Functional Suitability	Not Fulfilled
CAT-04	CAATs	Generate Report	Screenshot generate report gagal	Generate report doesn't generate transaction reports	ISO 25010 – Functional Suitability	Not Fulfilled
CAT-05	CAATs	Transaction Dashboard	Transaction dashboard screenshot	Customer transaction data is successfully displayed on the admin dashboard	ISO 27001 Annex A.12 – Logging and Monitoring	Meet
SMP-01	Sampling	Status Pending Admin	Screenshot of Pending status on admin dashboard	The status of the Pending transaction is successfully displayed on the admin dashboard	COBIT DSS01 – Manage Operations	Meet

SMP-02	Sampling	Customer Pending Status	Screenshot of the Pending status on the order tracking page	Pending status is successfully displayed to customers	ISO 25010 – Functional Suitability	Meet
SMP-03	Sampling	Status Processing Admin	Screenshot of the Processing status on the admin dashboard	The transaction status was successfully updated to Processing	COBIT DSS01 – Manage Operations	Meet
SMP-04	Sampling	Customer Processing Status	Screenshot of the Processing status on the order tracking page	Status changes are successfully displayed to customers	ISO 25010 – Functional Suitability	Meet
SMP-05	Sampling	Status Completed Admin	Screenshot of Completed status on admin dashboard	The transaction status was successfully updated to Completed	COBIT DSS01 – Manage Operations	Meet
SMP-06	Sampling	Status Completed Pelanggan	Screenshot of the status of Completed on the order tracking page	Completed status successfully displayed to customers	ISO 25010 – Functional Suitability	Meet
SMP-07	Sampling	Status Cancelled Admin	Screenshot of Cancelled status on admin dashboard	The status of the transaction was successfully updated to Cancelled	COBIT DSS01 – Manage Operations	Meet
SMP-08	Sampling	Status Cancelled Pelanggan	Screenshot of the Cancelled status on the order tracking page	Cancelled status successfully displayed to customers	ISO 25010 – Functional Suitability	Meet

4. Auditor's Analysis & Conclusions

a. Analysis

Based on the results of evidence collection using the inquiry, observation, inspection, re-performance, and CAATs methods on the Werdys Kitchen website, most of the main functions of the system have run well and support the website's operational processes.

The audit results show that:

- The admin login system works well using username and password authentication.
- The admin sidebar and quick action dashboard can be used consistently.
- The customer checkout process runs well without problems in entering customer data such as name, address, WhatsApp number, email, and notes.
- The tracking of orders via email went well.
- Customer transaction history has been successfully saved and can be displayed again on the admin dashboard.
- The auto-logout system successfully runs after the admin is inactive for approximately 20 minutes, thus supporting the security of user sessions.
- Checking the data using the CAATs method shows that no empty/null data was found on the customer's order form.

However, the auditor found several interrelated patterns of system weaknesses, namely:

- The generate report feature cannot generate transaction reports, while the summary dashboard does not display transaction data in actual and real-time. This shows that the integration of data reporting in the system has not been running optimally.
- The website logo does not appear on the navbar, the website banner is cropping so that the image is cropped, and the About Us page does not display complete business information. The findings show that the management of the website interface and information is still not optimal in terms of user experience.
- The social media link in the Contact Us section still shows a 404 error so the external integration feature of the website has not worked properly.
- The website experiences an error or crash if repeated bookings are made in the same time frame using the desktop. This condition shows that the system's performance is still unstable when receiving high transaction activity.
- Based on the results of the inquiry, data backups have not been carried out periodically so that it can increase the risk of data loss in the event of a system failure.

Based on the links between the evidence found, the auditor concluded that most of the weaknesses of the system lay in the following aspects:

- reporting system,
- performance efficiency,
- user interface,
- and website maintenance.

b. Provisional Conclusion

Based on the results of the audit that has been carried out, the main control on the Werdys Kitchen website in general has been quite effective in supporting the operational process of food ordering and customer transaction management.

This is evidenced by:

- the admin login process that runs well,
- the successful customer checkout process,
- tracking orders via email that run well,
- transaction history available on the system,
- as well as customer transaction data stored without finding an empty/null value.

However, the auditor assessed that the system still needs some immediate improvements especially on:

- Generate Report feature,
- dashboard summary that is not real-time,
- stability of the website when receiving repeat transactions,
- Display of the website interface,
- integrasi Contact Us,
- as well as regular data backup management.

5. Audit Constraints and Limitations

Audit Constraints

Yes	Audit Constraints	Impact on Audit	Auditor Mitigation
1	Data backups have not been done regularly	The auditor cannot verify the data <i>recovery</i> process directly	The auditor conducts an audit based on the transaction data available on the system
2	Generate report feature doesn't work	Auditors cannot obtain automated transaction reports from the system	Auditors use transaction history and admin dashboards as sources of data check
3	The dashboard summary does not show actual data	Auditors have difficulty validating transaction activity summaries in real-time	Auditor compares direct transaction data on the customer transaction dashboard
4	The website experiences an error/crash when the booking is made repeatedly in the same time	System stability testing is limited as the system needs a refresh and a ± 10 -minute wait time	The auditor performs a retest after the system returns to normal
5	Contact Us still shows 404 error	The auditor cannot verify the full social media integration of the website	The auditor documents the error as the audit finding
6	About Us information is not complete	Auditors have limitations in verifying business profile information through the website	The auditor obtains additional information through interviews with the admin
7	Audits using only 1 admin account	Multi-user access control testing is not possible	The auditor focuses the test on the available admin account

Audit Constraint Analysis

Based on the constraints found, most of the audit limitations stem from:

- system features that have not run optimally,
- limited data reporting,
- and there is no regular management of data backups.

However, auditors can still obtain adequate audit evidence through a combination of inquiry, observation, inspection, re-performance, and CAATs methods so that the audit process can still be carried out objectively and relevant to the current state of the website system.

Conclusion of Audit Constraints

Based on the results of the audit conducted, the obstacles and limitations of the audit did not hinder the overall audit process. Auditors can still obtain sufficient audit evidence to evaluate system functions, customer transactions, security of admin access, and website performance.

However, some limitations such as reporting features that are not yet running, dashboard summaries that are not real-time, and the absence of periodic data backups show that the website system still needs improvements in the aspects of monitoring, reporting, and data management to support the audit process and system operations more optimally in the future.
